PROFESSIONAL SUMMARY

Customer-facing technical lead and software engineer with 6+ years translating operational requirements into production warehouse automation systems across APAC. Combines on-site discovery, technical scoping, hands-on Java delivery, commissioning, code review, mentoring, and multilingual stakeholder communication. Open to relocate to Singapore and frequent international travel.

DEPLOYMENT AND TECHNICAL STRENGTHS

Customer delivery: Customer workshops Requirements / SRS Technical scoping Commissioning	Hands-on engineering: Java SQL System design Testing and debugging RAG prototyping
Technical leadership: Code review Mentoring Technical interviews Delivery risk coordination	APAC collaboration: English Mandarin Cantonese Malay

PROFESSIONAL EXPERIENCE

Midea Group Backend Lead Engineer (Technical Lead) China office and customer sites Direct employee	Dec 2024 - Jul 2026
- Led backend design and delivery across concurrent warehouse automation programs, translating on-site customer workflows into SRS documents, technical designs, and implementation plans. - Designed and implemented core system features while reviewing code and aligning contributors with shared engineering standards. - Coordinated technical scope, engineering capacity, dependencies, and delivery risks with customer and internal stakeholders. - Guided new engineers through warehouse-domain concepts, development setup, and delivery practices; participated in technical interviews. - Worked from Midea's China office and customer sites throughout the assignment, partnering directly with local stakeholders during discovery, implementation, and delivery readiness.	
Technology and domain: Java SQL Warehouse automation	
Swisslog Malaysia Sdn. Bhd. Software Application Engineer Malaysia office and regional customer sites Direct employee	Feb 2020 - Dec 2024
- Led module delivery for beverage-manufacturing and secure-printing facilities, from requirements analysis through implementation and commissioning support. - Built and maintained Java modules supporting receiving, putaway, cycle-count, inventory, and infeed/outfeed workflows across warehouse automation deployments. - Owned test planning and defect investigation for deployments serving global retail customers, collaborating with engineering and site teams through production readiness. - Supported international project commissioning in China, working on site with stakeholders to investigate issues and prepare systems for operational use. - Mentored new engineers on development setup, warehouse fundamentals, debugging, and the software delivery lifecycle.	
Technology and domain: Java SQL Oracle Database SQL Server Warehouse automation	

APPLIED AI PROTOTYPE

AI-Assisted WMS Troubleshooting Prototype

Internal prototype - not released

Designed a retrieval-augmented generation (RAG) assistant to make warehouse automation troubleshooting knowledge easier to access when inventory or process failures occurred.

- **Prototype V1:** Ran a compact language model on a project server and used RAG to retrieve relevant workflow documentation and diagrams, suggesting where support engineers could begin an investigation.
- **Planned V2:** Would extend retrieval to source-code context and read-only database queries so the assistant could narrow likely failure causes and provide diagnostic guidance without exposing proprietary code to end users.

Work concluded at prototype stage when the role ended; it was not released to customers or operated in production.

SELECTED ENGINEERING EVIDENCE

Warehouse workflow engineering

Designed Java application logic for receiving, putaway, cycle-count, inventory, and material-flow workflows across enterprise warehouse automation environments.

Customer-led technical delivery

Translated customer operations into SRS documents and technical designs, then coordinated implementation, delivery risks, and readiness with engineering and site teams.

Quality and production readiness

Planned functional testing, investigated defects, reviewed code quality, and supported commissioning as automation modules moved into operational use.

DEPLOYMENT SCOPE

Requirements and technical design

Translate customer workshops and warehouse workflows into SRS documents, system boundaries, technical designs, and implementation plans.

Technical leadership and delivery coordination

Review code, mentor engineers, and coordinate capacity, dependencies, blockers, and readiness with customer and delivery teams.

Backend implementation

Design and maintain Java application modules for inventory and material-flow workflows backed by SQL databases.

Testing and operational readiness

Plan functional tests, investigate defects, review code quality, and support commissioning into live warehouse operations.

ADDITIONAL EXPERIENCE AND PARTNERSHIPS

NetEase - Malaysia Market

2022 - Present

External / KOL Partner | Remote

- Conduct product research, market surveys, structured player interviews, and pre-release testing for game-network products in Malaysia.

Sirius Lab

2021 - 2024

Founder / Software Architect | Malaysia

- Led product architecture and project-delivery oversight for a small independent software venture.

EDUCATION

Bachelor of Information Technology (Honours), Software Systems Development

Tunku Abdul Rahman College, Kuala Lumpur | 2020

Diploma in Information Systems Engineering, Computer Science

Tunku Abdul Rahman College, Kuala Lumpur | 2017

LANGUAGES

English (Fluent) | Mandarin (Fluent) | Cantonese (Fluent) | Malay (Fluent)

Mobility: Open to relocate to Singapore | Open to frequent worldwide travel
